## **STEP UP TO THE PORTALS.**

As you walk around the portals, soft chimes and flickering specters respond to your movements, creating a surreal, immersive experience. The Light Portals use repetition, sound, and subtle interactivity to make visitors feel surrounded by living light, blending the natural and the otherworldly to make the Portals feel malleable and alive.

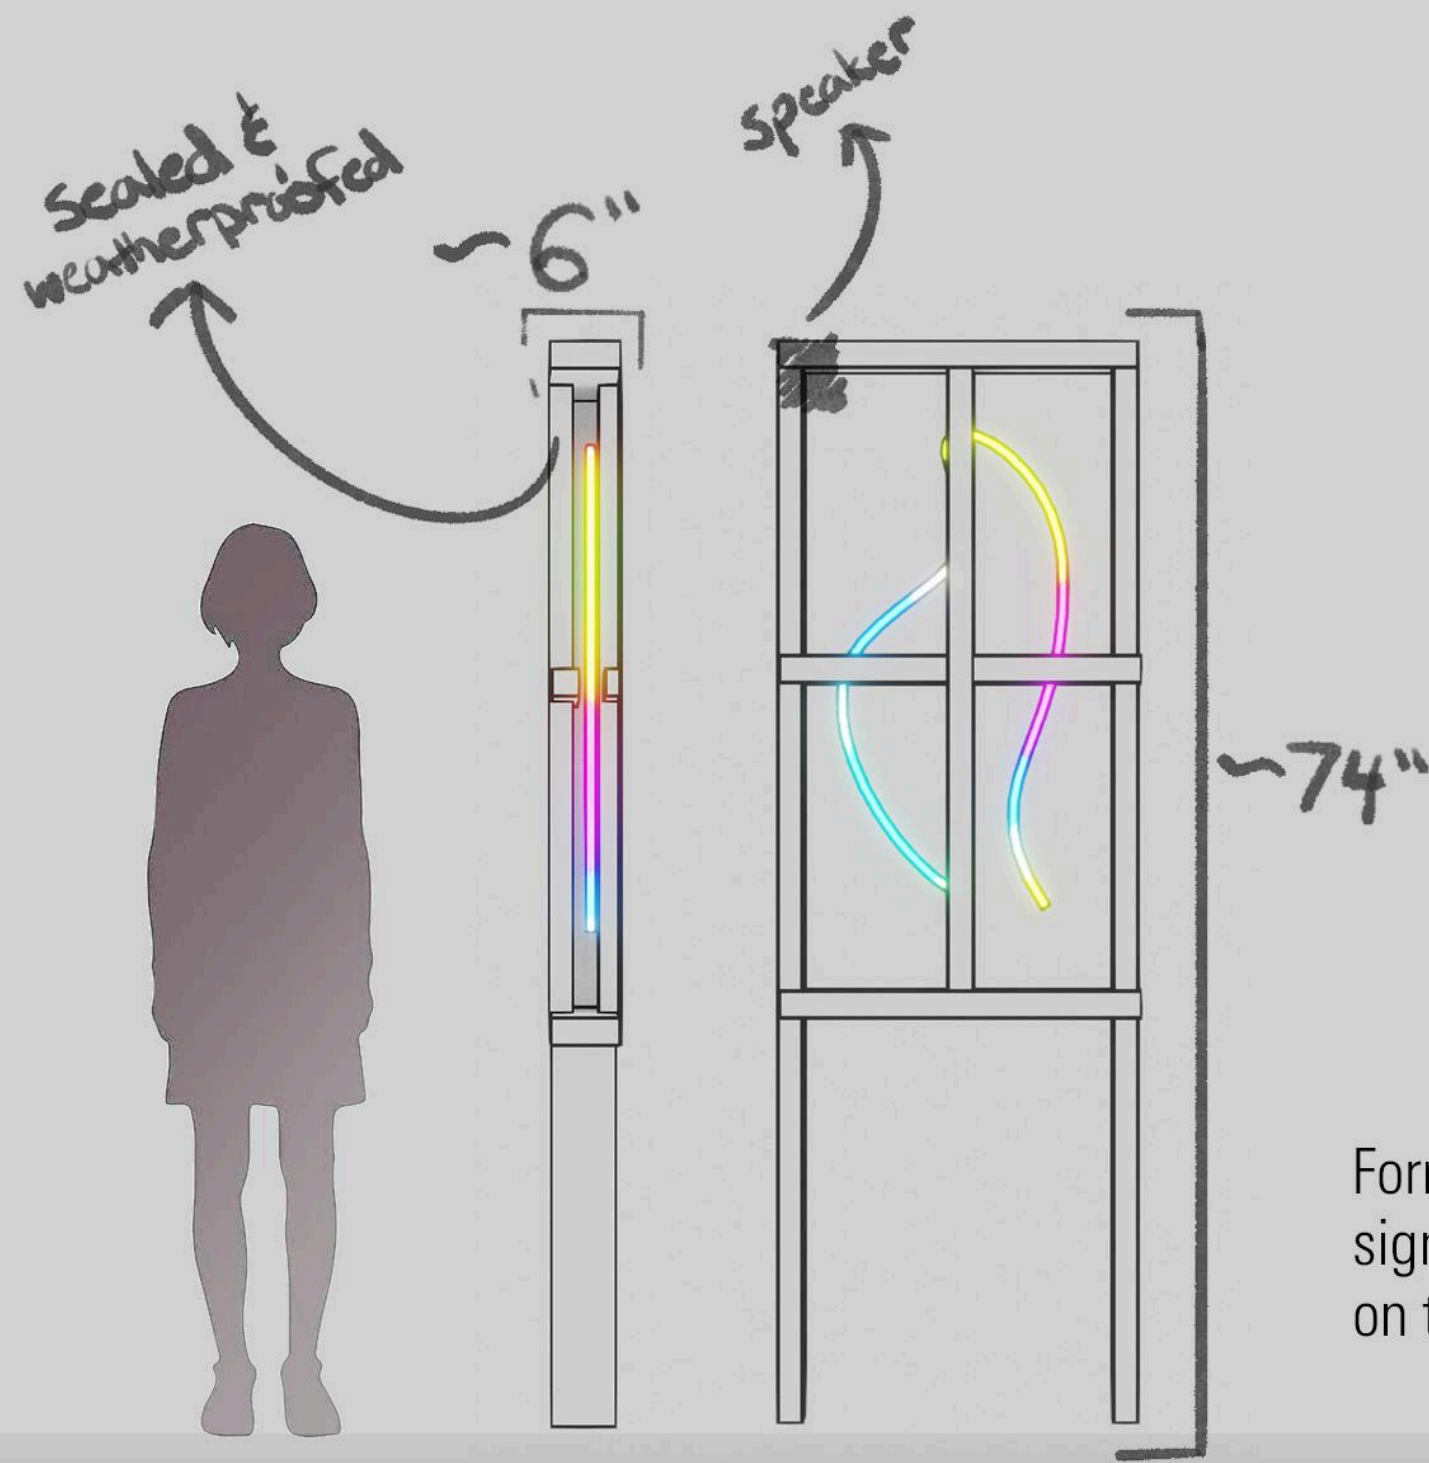

# HOW IT WORKS

Our Light Portals are built from reclaimed materials, letting the light of the past shine through and inviting visitors to imagine the history of Cincinnati beneath their feet.

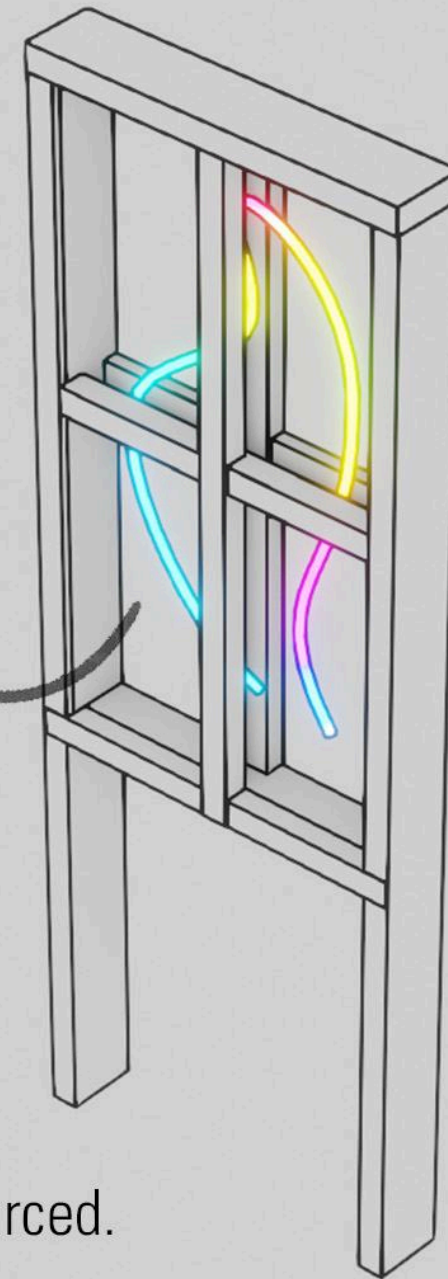

The installation will be a construction of eight individual wooden frames from reclaimed windows and doors, with programmable multicolor LED strips sealed between two panes and fully waterproofed. Each LED responds to data from proximity sensors, changing hue, intensity, and pattern to bring the illuminated “forest specters” to life. A programmable synthesizer will adjust notes and timbres based on visitor movement, fading tracks in and out and shaping waveforms for a more immersive experience. Each portal will feature a single speaker on the top, creating a compact surround sound setup.

LED Strip

Forms may vary  
significantly depending  
on the specific materials sourced.

# BACKGROUND

Light Portals is an installation for Cincinnati Nature Center's *Light in the Forest 2025* (December 2025). We are proposing a simple upgrade to use the same portals for Blink 2026.

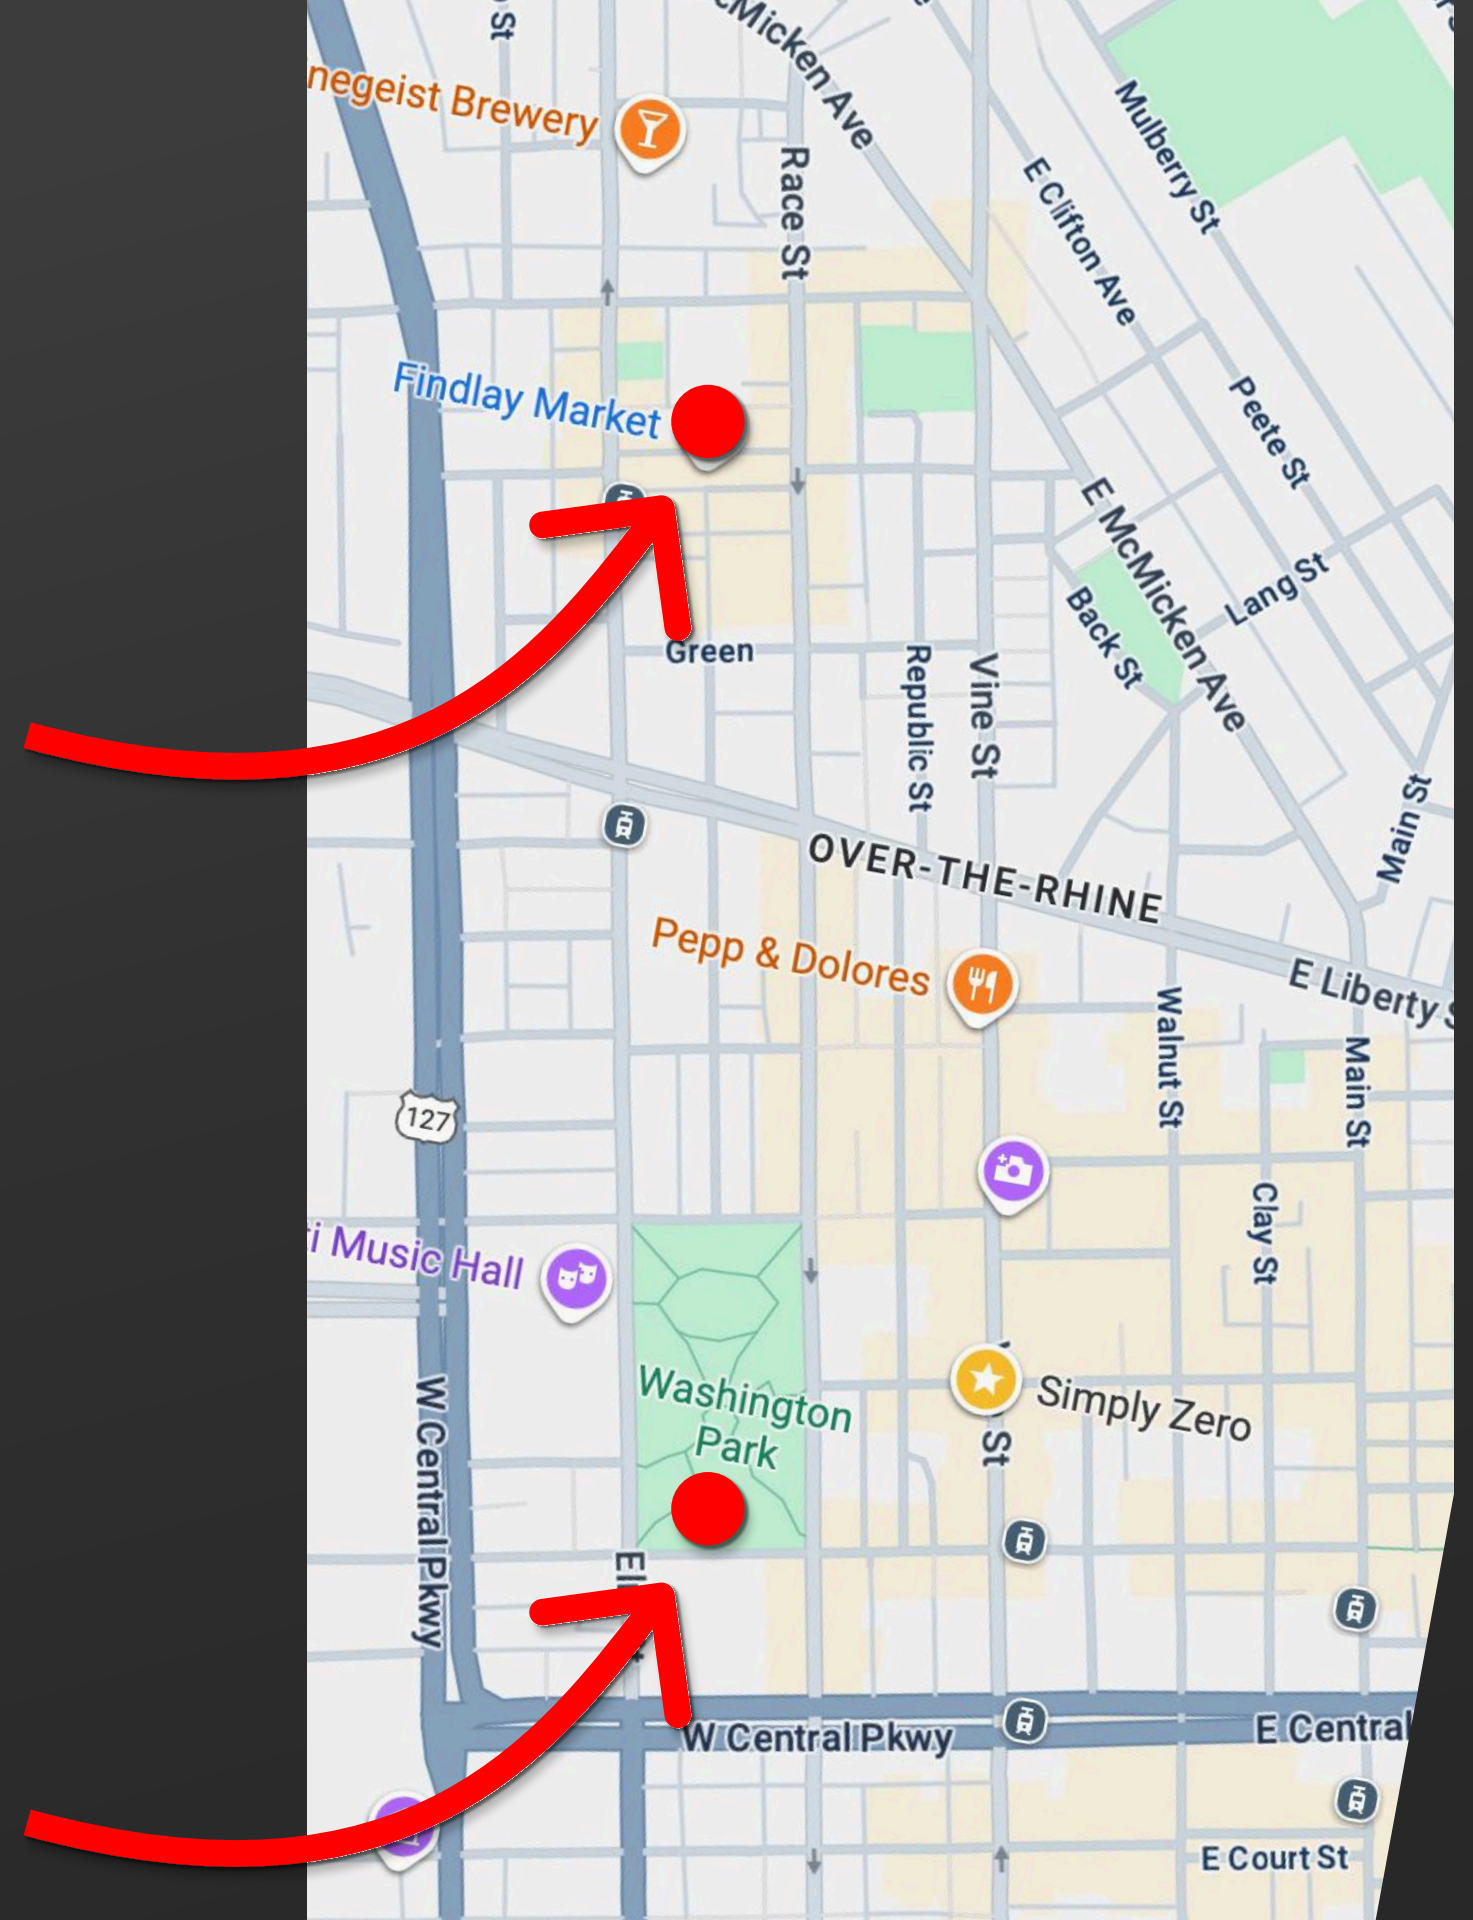

We have a separate proposal submitted for an "Orchestra of Light" that dramatically enhances the concept and technology around these portals. This submission of the existing project is offered both as an alternative or as a second installation for Blink.

To follow the progress on the construction and installation of Light Portals for *Light in the Forest*, follow @hermgreider on Instagram.

## APPROXIMATE LOCATION - PARKS AND ALLEYWAYS

Places like Washington Park or Findlay Market, or streets in between.

Somewhere that families will be loitering rather than passing through, and where the interactive sound can be experienced without much distracting background noise.

## **Herm Greider**

Retired Software Developer with 40 years experience leading, designing, and coding all types of software systems for defense and commercial applications. BS Computer Science, UC. MS CS Wright State. Currently building lighting and sound projects.
